

At Asset Panda, we're constantly seeking ways to innovate our product and enhance the customer experience. That's why we launched Asset Panda PRO, a re-imagined asset management platform designed to help organizations work smarter.

While Asset Panda PRO and our original Asset Panda Classic platform share various similarities, there are several differences to note as well. Here's how Asset Panda PRO and Classic compare in 5 key areas.

PRO

VS

Classic

Mobile App with Offline Mode

The Asset Panda PRO mobile app empowers your team to perform workflows from anywhere, even when offline. Whether you have team members on the road or out in the field, they can continue to access information and update records without WiFi or cell service.

Required WiFi or Service for Mobile App

The Asset Panda Classic mobile app allows you to view and update asset records on the go for increased productivity. With access to WiFi or cell service, our companion mobile app enables your team to uphold workflows from the road or the job site.

Consolidated Account Structure

Create unique accounts for each of your locations or clients under one centralized instance with Asset Panda PRO. From enterprises to managed service providers, our consolidated account structure makes it easy to manage everything in one secure place and scale your platform as your business grows. Easily report on one or all of your child accounts and maintain transparency into various clients or locations.

Multiple Accounts Needed for Various Locations or Clients

With Asset Panda Classic, each unique account requires its own standalone instance. Enterprise organizations and managed service providers can set up fully scalable accounts for each of their branches or clients and can report on one child account at a time.

Conditional Smart Forms

Asset Panda PRO allows you to seamlessly create and update asset records with conditional smart forms. Whether you're looking to assign assets or create a service ticket, you can build a custom smart form with conditional fields and save it for later use.

Actions

Asset Panda Classic offers customizable Actions to update asset records. Actions require Change Fields, which can change an item's status when it is checked out or sent for repair. Actions are created at the Group level, which means they need to be re-created if used in additional Groups.

Automations

With Asset Panda PRO, you can easily configure automations based on conditional fields. When a condition is met, such as a certain time interval passing, then you can automatically trigger an action, like a notification to calibrate a piece of equipment.

Manual Workflows

While Asset Panda Classic allows you to set up custom notifications to alert you of key calibration dates, low inventory levels, and more, any related workflows must be performed manually with Actions.

Filtering and Saved Views

Asset Panda PRO enables you to customize your list fields and rearrange their order based on the information that matters most to you. Easily filter and group your assets by specific fields and field conditions. Rather than filtering and sorting your asset list every session, you can create unlimited saved views in your unique account and even share them with other users in your Asset Panda instance.

Pinned Filters

Asset Panda Classic allows you to filter assets by specific fields, such as location or status, and each unique user can pin up to 25 filters per asset Group. You can also share Pinned Filters with other users or user templates in your Asset Panda program, but they will not be able to access it if they've already reached their 25 Pinned Filter limit.
